Ideation Phase

EMPATHY MAP

Date	**07 March 2026**
Team ID	**SWTID-2026-8307**
Project Name	**Enforcing Mandatory fields using UI policies and migratting Changes with update sets**
Maximum Marks	**4 Marks**

1. Understanding the User

In the empathy phase, the main goal is to understand the users and their real needs. Teams try to learn about the users' experiences, challenges, and expectations. By observing and communicating with users, the team can collect useful insights about the problems they face in their daily activities.

2. Identifying User Needs

After understanding the users, the next step is identifying their needs and difficulties. This helps the team clearly recognize the actual problem that needs to be solved. Understanding user needs ensures that the ideas developed later will be practical and useful for the target users.

3. Methods Used in Empathy Phase

Different methods such as interviews, observation, and simple surveys are used to gather information from users. These techniques help the team understand how users think, feel, and interact with the product or system.

4. User Observation

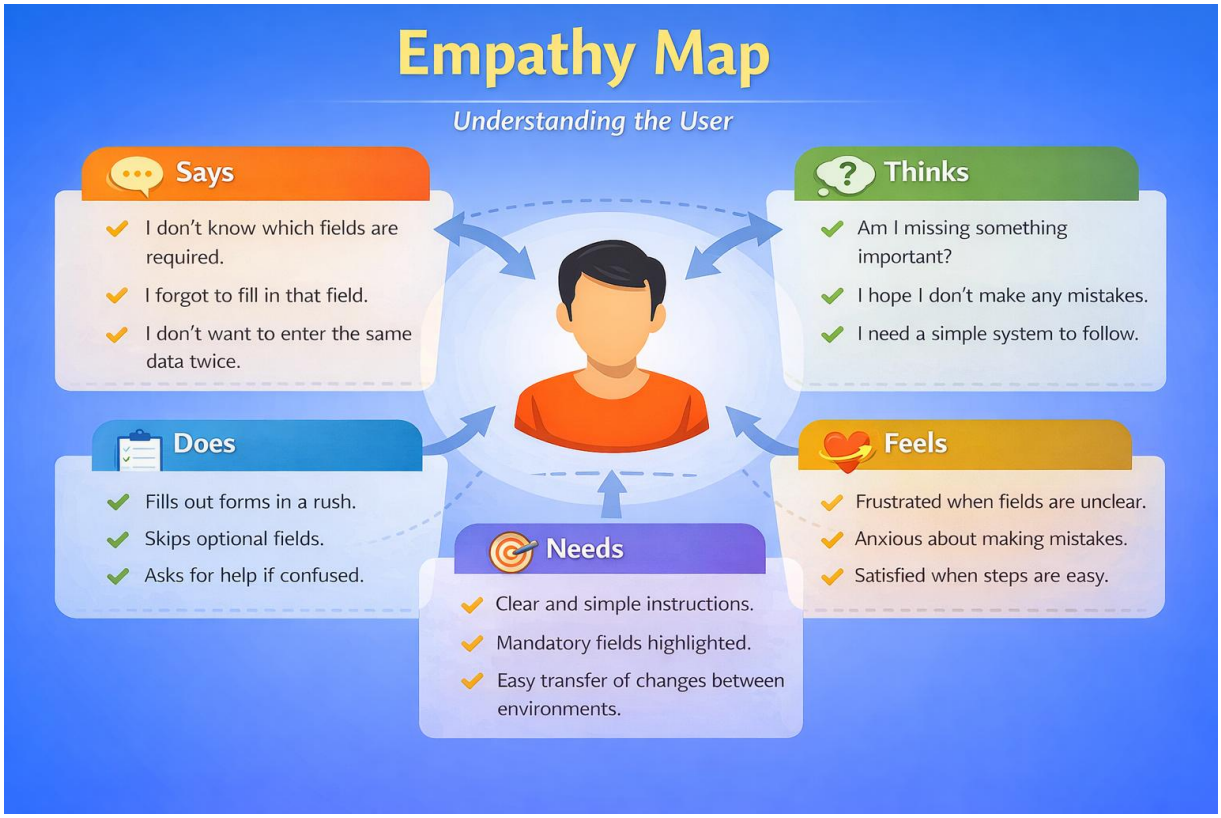
In the empathy phase, observing users while they perform their daily activities helps the team understand their behavior and challenges. Observation allows the team to notice problems that users may not directly mention.

5. Collecting Insights

All the information collected from users is analyzed to identify important insights. These insights help the team understand the real needs of the users and guide them in generating effective ideas.

6. Importance of Empathy Phase

The empathy phase is important because it focuses on understanding people rather than only focusing on the problem. It helps the team create solutions that are meaningful and useful for users.

7. Understanding User Experience


User experience is an important part of the empathy phase. The team studies how users interact with a product or system and what kind of difficulties they face while using it. Understanding user experience helps in identifying the gaps and improving the design of the solution.
