Requirement
Data flow digram

Date	**07 March 2026**
Team ID	**SWTID-2026-8307**
Project Name	**Enforcing Mandatory fields using UI policies and migratting Changes with update sets**
Maximum Marks	**4 Marks**

Data Flow DiagrAm (DFD)

The Data Flow Diagram represents how data moves through the system when enforcing mandatory fields using UI Policies and migrating configuration changes using Update Sets in the ServiceNow platform.

The process begins when the **user submits a form** in the ServiceNow interface. Before the form is submitted, **UI Policies** check whether the required fields are filled. If mandatory fields are missing, the system displays a message and prevents the form submission.

Once the required fields are properly filled, the data is stored in the **ServiceNow Development Instance database**. During development, administrators or developers create UI policies and configure system settings to enforce mandatory fields.

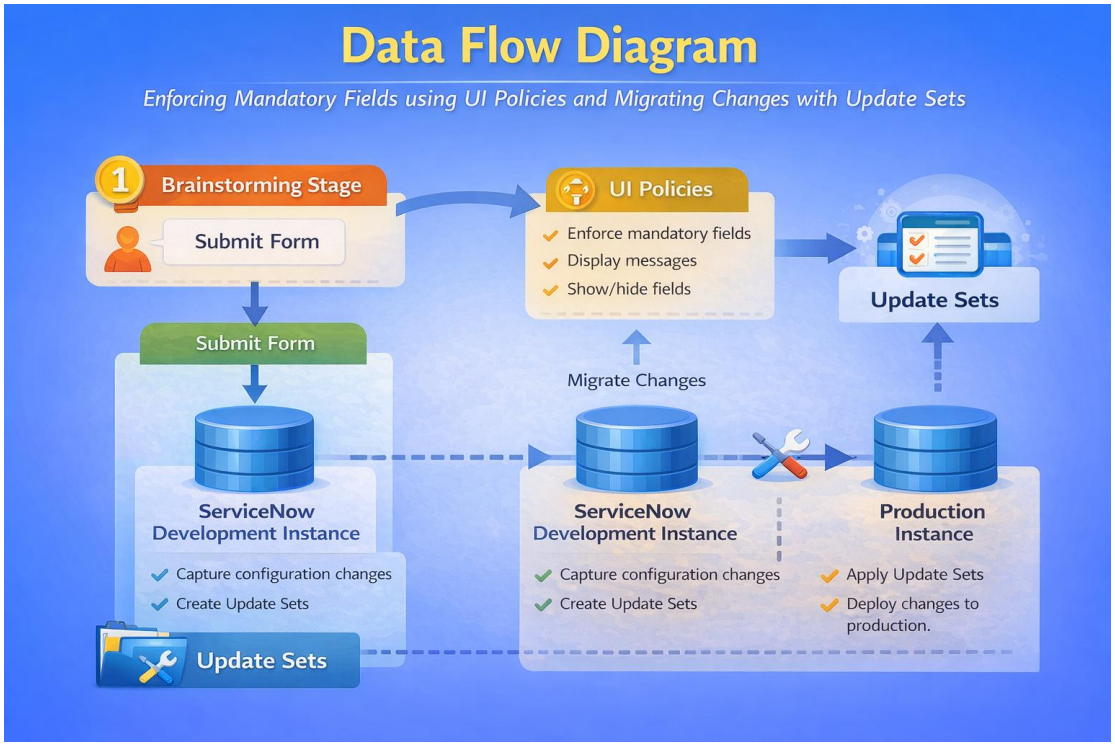
These configuration changes are automatically captured in **Update Sets**. Update Sets help track all configuration changes made in the development instance.

After the development work is completed, the captured Update Sets are **migrated to another instance**, such as testing or production. The update sets are then **applied in the target instance**, ensuring that the same UI policies and configurations are implemented in that environment.

This process ensures **data integrity, proper validation of mandatory fields, and safe migration of system configurations across ServiceNow environments.**

DFD Components

External Entity:
User – The person who interacts with the ServiceNow system and submits forms.

Data Stores:
• ServiceNow Development Instance
• ServiceNow Production Instance


Data Flow:
• User submits form data
• UI Policy validates mandatory fields
• Data stored in development database
• Configuration changes captured in update sets
