Technology Stack

The technology stack refers to the set of technologies, tools, and platforms used to develop and implement the system.

1. Platform

ServiceNow Platform
ServiceNow is a cloud-based platform used for IT service management and workflow automation. It provides tools to manage incidents, requests, and system configurations efficiently.

2. Programming Languages

JavaScript
JavaScript is used in ServiceNow for scripting purposes such as client scripts, business rules, and UI policies to control form behavior.

3. Configuration Tools

UI Policies
UI Policies are used to dynamically control form fields in ServiceNow. They can make fields mandatory, visible, or read-only based on specific conditions.

4. Migration Tool

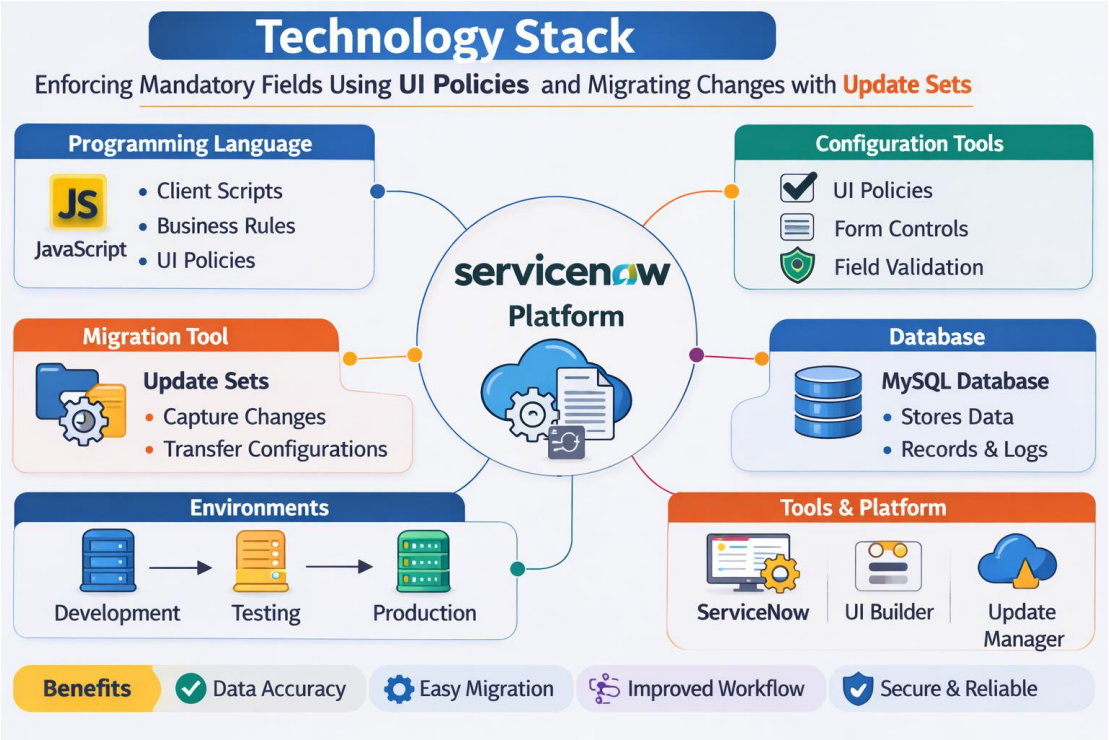
Update Sets
Update Sets are used to capture configuration changes made in the development instance and migrate them to other instances such as testing or production.

5. Database

ServiceNow Database (MySQL-based)
ServiceNow uses a relational database system to store application data, configuration details, and system records.

6. Development Environment

ServiceNow Development Instance
Developers create and test configurations such as UI policies, scripts, and forms in the development instance before moving them to other environments.

7. Testing Environment


ServiceNow Test Instance
The test instance is used to verify that the update sets and configurations work correctly before deploying them to production.
