Project Design Phase
Proposed Solution

Date	**07 March 2026**
Team ID	**SWTID-2026-8307**
Project Name	**Enforcing Mandatory fields using UI policies and migratting Changes with update sets**
Maximum Marks	**4 Marks**

Proposed Solution

Introduction

The proposed solution aims to improve data accuracy and system configuration management within the ServiceNow platform. In many cases, users may submit forms without completing important fields, which can lead to incomplete records and workflow issues. Additionally, managing configuration changes across different ServiceNow environments can be challenging if proper migration methods are not used.

To address these problems, the solution uses **UI Policies** to enforce mandatory fields and **Update Sets** to capture and migrate configuration changes between ServiceNow instances.

Enforcing Mandatory Fields Using UI Policies

UI Policies in ServiceNow allow administrators to control the behavior of form fields without writing complex scripts. Using UI Policies, specific fields can be made mandatory based on defined conditions.

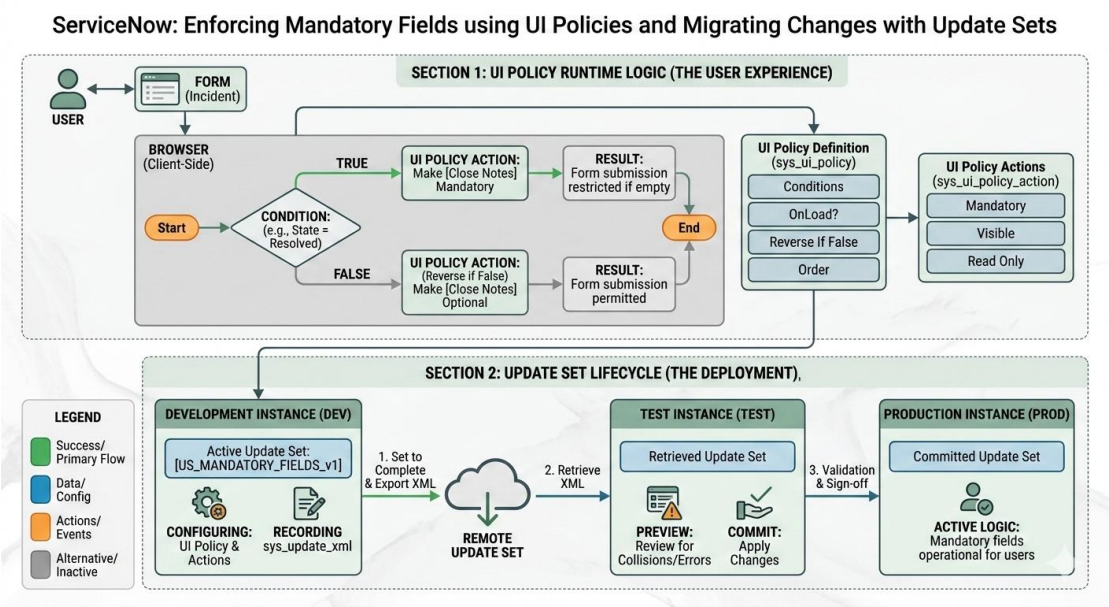
When a user attempts to submit a form, the UI policy automatically checks whether required fields are filled. If any mandatory field is missing, the system displays a validation message and prevents the form submission until the required information is entered.

Migrating Changes Using Update Sets

Update Sets are used in ServiceNow to track and migrate configuration changes from one instance to another. When developers create UI policies or modify system

configurations in the development environment, those changes are automatically captured in an update set.

Benefits of the Proposed Solution

The proposed solution provides several advantages:


• Ensures that important fields are always filled before form submission
• Improves data accuracy and consistency
• Reduces errors caused by incomplete records
• Simplifies configuration management in ServiceNow
